

An aerial, top-down view of a large number of identical security cameras mounted on a light-colored, textured concrete floor. The cameras are arranged in a somewhat regular, grid-like pattern, though not perfectly aligned. Each camera is a dark, rectangular unit with a lens pointing downwards, mounted on a short, dark, adjustable arm. The lighting is even, highlighting the texture of the floor and the uniformity of the devices.

Biosurveillance: a systems view

Center

Biosurveillance system

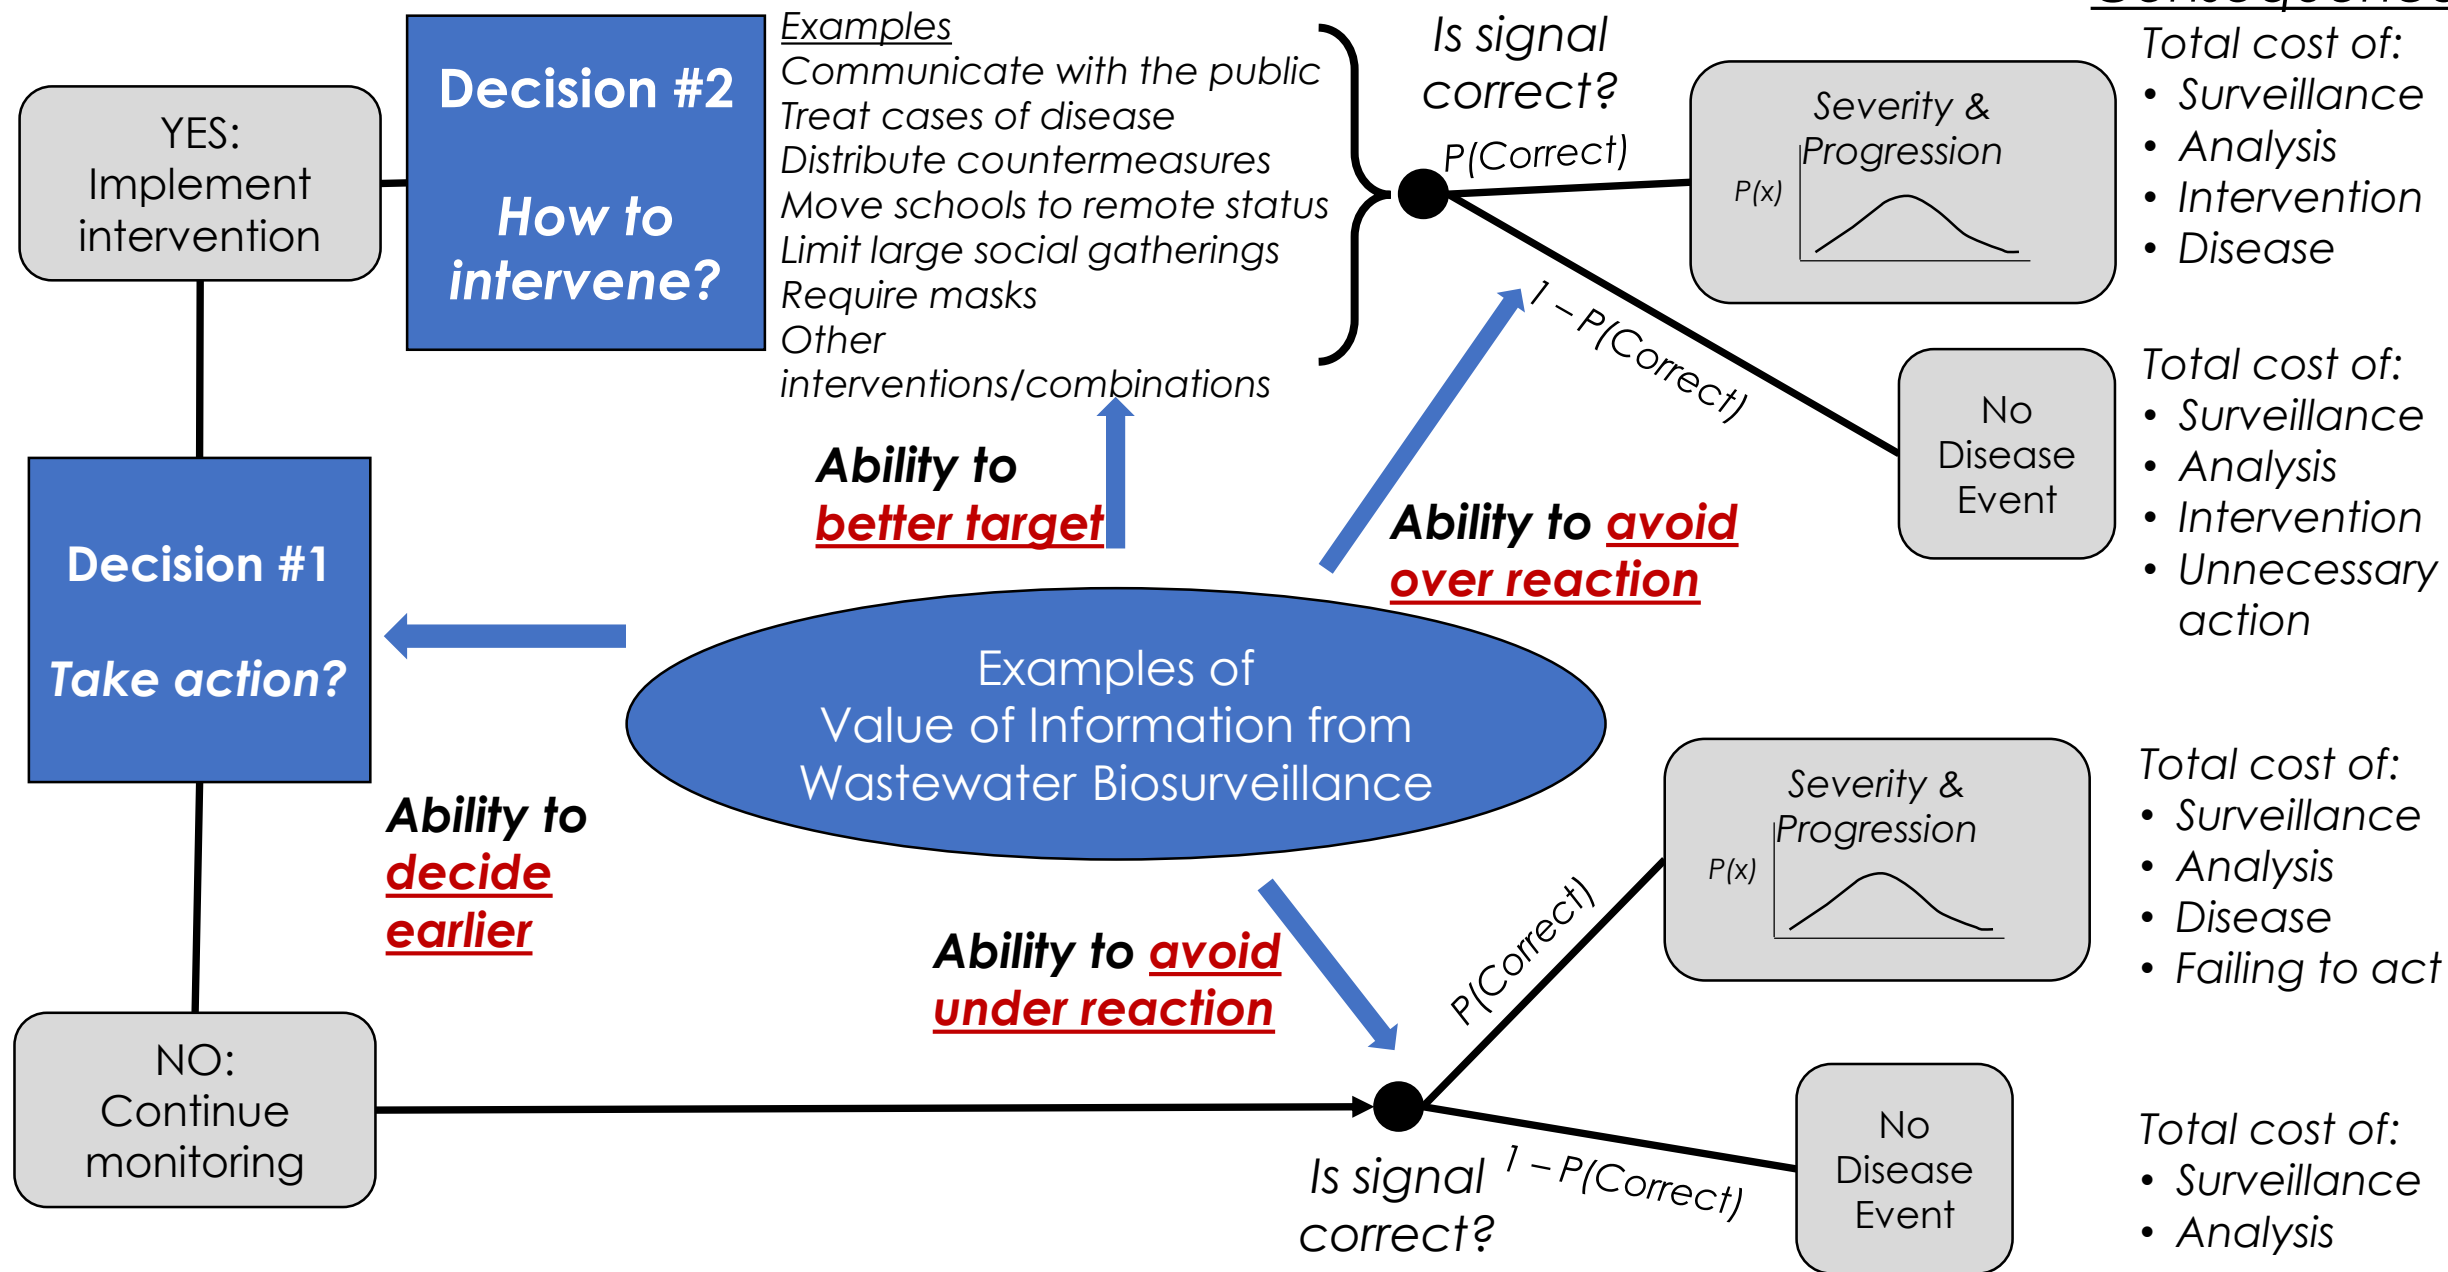

Global initiatives mapping exercise yielded insights on the range and types of work ongoing in biosurveillance:

- Bespoke pathogen surveillance ongoing e.g. Covid-19, Influenza
- Broader agnostic surveillance measures e.g. foodborne, environmental, AMR
 - Most initiative cover a range of pathogens which has implications for sampling, testing and metagenomics infrastructure
- 25% of initiatives mapped were international in remit
- Initiatives are focussing on different aspects of the value chain whilst some straddle across the chain

Emerging evidence: pathogen-agnostic biosurveillance is a lot cheaper than anticipated. These cost reductions can be achieved by using multiple other technologies (such as wearables, mPCR, other environmental indicators, etc.) to prioritize when to perform metagenomic sequencing

Considering the Value of Information from the system

Costs and Consequences

Factors influencing benefits of the system

Technology

Physical and digital
infrastructure

Data and information
access

Existence, effectiveness
and cost of
countermeasures

Geography and
Demography

Transmission
mechanisms and routes

Pathogenicity

Rapidity and
consistency of response

Our evidence on gaps in knowledge and infrastructure

Data collection

- Supply chain (e.g. consumables, PPE)
- Connectivity (e.g. internet, physical access)
- Lack of metadata (e.g. source, location)

Information generation

- Siloed data sets (e.g. no interoperability)
- Political pressure (e.g. underreporting and economic repercussions)
- Physical samples crossing international borders (e.g. Nagoya Protocol)
- Full burden of disease on societies including how the burden is distributed and shared
- Full cost of countermeasures on economies and societies, including how the costs are distributed and shared

Decision-making

- Genomic surveillance is fragmented
- Fragmented threat detection (e.g. not scalable, lack of robust meta genomic approaches)
- Evaluations of response systems and strategies

Moving the dial on biosurveillance

Advancements of both technology and systems thinking and design is needed

- Capacity building for genomic surveillance
- Meta-genomic pilots and scalable threat detection
- Strengthening the information sharing and decision-making interface with the response mechanisms locally, nationally and globally and cross sectorally
- Technology pilots and testbeds
- Inclusion of end users/decision makers in technology and system testing
- Building holistic evaluations into testing
- Assessment of the costs and effectiveness of biosurveillance-informed response
